

Hot Stamping Cylinders

Spilker hot stamping cylinders point the way for high quality hot foil stamping for many years

One important requirement for a neat stamping of foils without burr is a high engraving depth. This requirement is only fulfilled by the application of brass cylinders. Therefore it is possible to realise even the smallest gaps and filigree texts.

Modern advanced technologies as well as the experience of more than five decades guarantee optimal stamping results. Filigree stamping motives with a maximum of register accuracy are developed in consideration of the particular stamping temperature.

The cylindrically ground, polished and hard chrome plated surfaces increase the durability of the tools and lead to constant results.

Furthermore Spilker offers fast and uncomplicated possibilities of reparation in case of damage and abrasive wear.

Of particular importance for the filigree stamping elements is the constant and exact tempering of the tools. According to the requirements and intended use Spilker offers oil as well as electric heated tools.

Your advantages

- Surfaces precisely ground and polished
- Repairable in case of damage or wear
- Shorter setup time through optional axle system
- Optional hard anodized coating
- Short delivery times
